

Exercise 1:

- This exercise was really interesting because with the gcc -E flag which I didn't know, shows the preprocessed code, this ppcode helps to understand the flow and assert that it does what we want. The traductor showed also a set of warnings that we needed to solve.
Then I ran the code and I got a successful and expected output.

Exercise 2:

- I compile and ran the code successfully, with the expected output in multiple test cases.

Exercise 3:

- I had an issue on this exercise where the extern function feed by the other file was not sat as "extern", once I specified, it ran successfully

The evidence of this work can be found here:
